

PROJECT OVERVIEW

LOGISTAR - Enhanced data management techniques
for real time logistics planning and scheduling

- About LOGISTAR
- Overall concept
- Work packages structure
- Partners and roles

About LOGISTAR

Consortium of **15 partners**, coordinated by the University of Deusto (Spain)

- Budget: **4.997.548,75 €**
- Duration: **36 months** (Started June 2018)

Project managed by INEA agency - Innovation and Networks Executive Agency (European Commission)

Project funded by H2020:

- Work programme: **Smart, green and integrated transport**
- Call: MG-5.2-2017: **Innovative ICT solutions for future logistics operations**

LOGISTAR overall concept

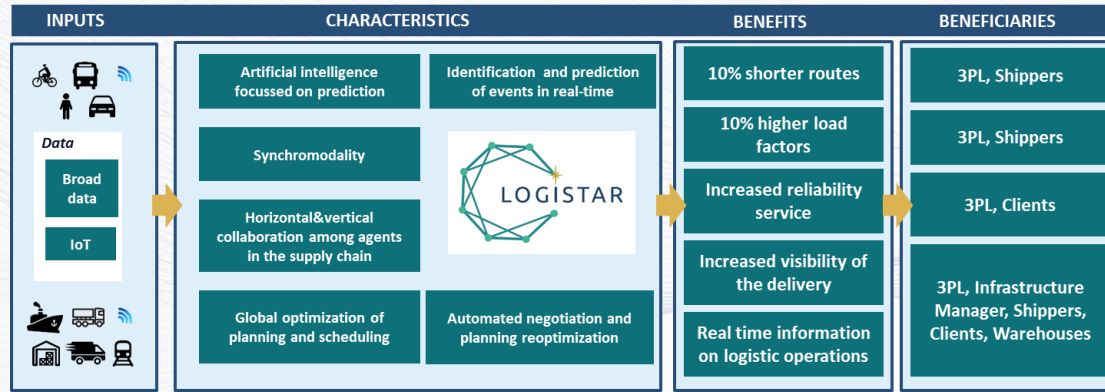

LOGISTAR aims to: allow **effective planning and optimization of transport operations**

- By taking advantage of **horizontal collaboration** and relying on the increasingly **real time available data** gathered

Development of a **real-time decision making tool** and a **real-time visualization tool** of freight transport

- With the **purpose of delivering information and services** to the various agents involved in the supply chain

LOGISTAR overall concept

- ✓ **Increasing by 10% the load factors of freight vehicles:** optimization techniques
- ✓ **Shortening by 10% the delivery routes** by relying on synchromodality
- ✓ **Increasing the reliability and efficiency of services:** predicting events and incidents.
- ✓ **Facilitating the management of logistic operations:** providing dashboards and showing alerts or recommendations.
- ✓ **Increasing the visibility of the delivery** derived from the use of sensors to monitor the goods shipped and boosting data sharing

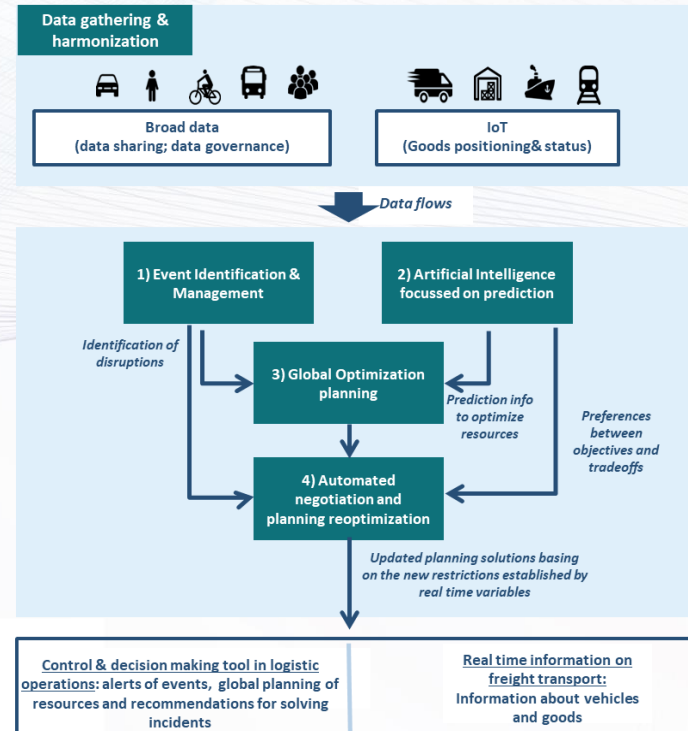

LOGISTAR overall concept

Specific objectives

- Identify **logistic open data sources** and **harmonize** this with the closed sources
- **Increase accuracy planning of operations** by applying **artificial intelligence**:
 - Timing predictions
 - Learning preferences of logistic chain participants
- Identify potential **disrupting events** and take relevant actions with **machine learning**
- Make the **best use of resources**
 - Provide possibilities for horizontal collaboration
 - Provide **optimization methods to transshipment planning and scheduling** in hubs and freight transport networks
- **Allow the negotiation among different agents** involved in the supply chain **considering any constraints arisen in real-time**

LOGISTAR overall concept

- To **leverage the available data**, to process it and **to deliver services**
 - Data will be retrieved and harmonized
 - Sensors will be **connected to a cloud IoT platform**
- Information used by **smart algorithms for**
 - Predictions
 - Learning the preferences
 - Optimization of the planning of operations
 - Automated negotiation and re-optimization
- Real-time dashboards** which will provide an overview to managers of what is happening

Key innovation aspects

- **Artificial Intelligence focused on prediction**
 - Inference based on **event detection and probabilistic programming** frameworks
- **Global optimization planning**
 - Realistic **optimization models** based on Robust and Multi-Objective Optimization.
 - **Hybrid metaheuristics** based on paradigms of parallel computing
- **Automated negotiation and planning re-optimization**
 - **Constraint satisfaction** problem solving techniques
- **Event Identification Rules**
 - A new application domain for the processing of complex events and their aggregation
- **Service layer – Decision making tool**
 - Increased data gathering, cleansing and structuring
- **Data gathering techniques**
 - **ETL tools** for Linked Data. Scraping and transforming

Services

- Optimized planning of resources
- Optimal routes for deliveries
- Identification of events
- Dynamic planning reconfiguration
- Horizontal/vertical collaboration
- Synchromodality management

- KPIs of real time logistics
 - Position of goods
 - Operational status
 - Working conditions
 - Arrival times
 - Environmental conditions

Collaboration opportunities among FMCG

Backhauling and Co-loading

To improve backhauling management

Overall overview of the status of the operations

Sychromodality

Real time re-planning due to disrupting events

Planning of sychromodal routes

Dynamic assignation of freight transport networks

Real time monitoring

Living labs

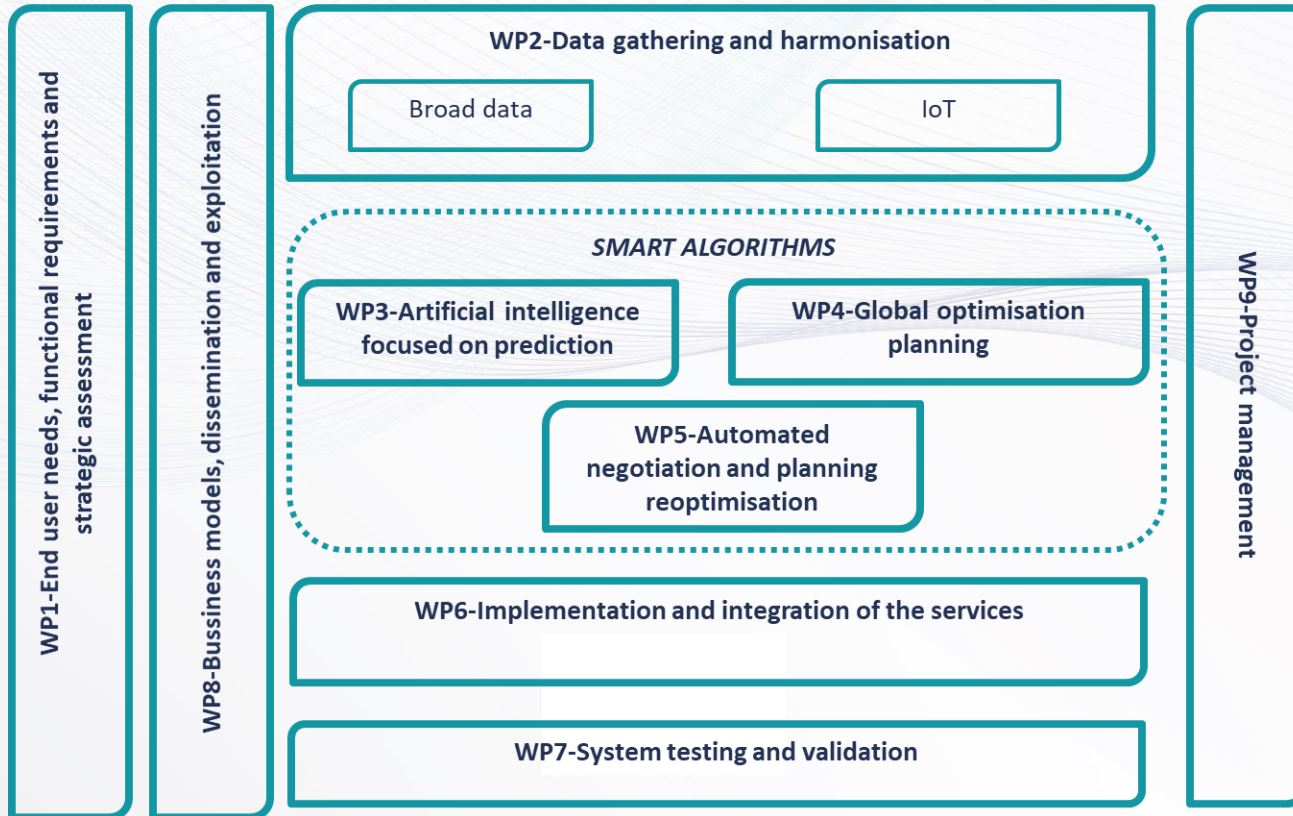

Reduction of empty kms

Real-time optimization of the transport network

Improve trips combinations

Work packages structure

 	Project Coordinator Global optimization planning techniques	 dbh Logistics IT AG	Implementation and integration of services
	Artificial Intelligence techniques focused on prediction		Geo-special oriented software solutions
	Automated negotiation algorithms		Testing and validation – Real time logistics in chemical industries use case
	Cloud IoT data		Testing and validation – Synchronmodality use case Dissemination activities
	Data gathering and harmonization		Testing and validation – Backhauling and co-loading use case
	End-users engagement		Testing and validation – Backhauling and co-loading use case
	New and emerging business models assessment		Testing and validation – Synchronmodality use case
	Predictive analysis and processing of real-time data
